

Doesn't restrict the oscillation/steering of the tractor*

Awesome stability - weight is transferred directly through the front wheels rather than the chassis

Recommended use: TNF, TNN, TNS tractors (plus A-series)

Increased Productivity

Hustler Rolatrac is a patented, innovative front mounting system that takes full advantage of the popular New Holland Supersteer tractors. Unlike conventional mounting systems, Rolatrac allows a forklift to be fitted without significantly reducing the oscillation or the exceptional steering lock offered by the New Holland Supersteer.*

The weight is taken by the front axle and the top is retained by a roller running in a radius track - hence the name Rolatrac.

Hydraulic tilt is standard equipment on the Hustler Rolatrac and, coupled with the Hustler VMX mast, provides the ultimate forklift unit for the New Holland Supersteer tractor.

INCREASED MANOEUVRABILITY

Because the forklift follows the front wheels, less room is required to manoeuvre a load. This provides a real increase in productivity in orchard and packing shed situations. Sideshift is not required, because half a turn of the steering wheel results in 75mm of sideways travel.

INCREASED STABILITY

Because the forklift is mounted directly to the front axle, a huge increase in stability is obtained. The stability does not decrease as load is increased.

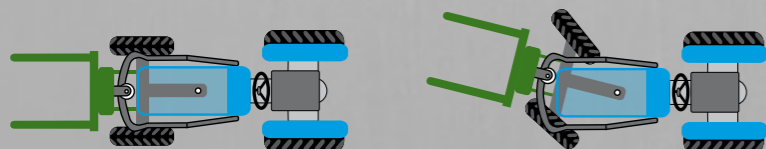

“After a couple of days, we found we could achieve 30-50% more with this machine than with any of our other conventional tractor and forklift combinations.”

FIELD OPERATIONS MANAGER, KIWI FRUIT COMPANY, BAY OF PLENTY

* Oscillation/steering lock of tractor may be restricted depending on tyre sizes and other factors.

THE ROLATRAC SYSTEM

Half a turn of the wheel results in 75mm of sideways travel
